

Project Charter
Ryan Hammer / BlueBlooded App

Team Members:

Luke Smith

Problem Statement:

The college basketball world has expanded so much as analytics, statistics, and viewing experiences have become much more accessible for the average fan. Content creators such as Ryan Hammer have created comprehensive platforms that condense this information into easily accessible formats. However, creators post on TikTok, Instagram, and other social media outlets, and do not have a complete consolidation of all of the information they provide and the statistics they use. The goal of this app is to consolidate all of that information, creating one application where you can see commonly used statistics, analysis of current college basketball landscapes, and other content from creators.

Project Objectives:

1. Create a consolidated platform that contains college basketball news, analysis, and statistics.
2. Allow content for creators like Ryan Hammer to upload material such as podcasts or short-form videos.
3. Have an easily accessible platform, where users can understand information and know where to go for it.
4. Collaborate with teams and other creators to advance statistics and allow creators like Ryan Hammer to see trends more clearly
5. Develop a successful prototype for a July launch as a solo developer

Stakeholders:

Users: College basketball fans and creators

Developers: Luke Smith

Testers: Luke Smith

Project Owners: Luke Smith, Ryan Hammer

Deliverables:

- College basketball statistics dashboard, with graphs like the Trapezoid of Excellence and information like possible national champions
- Podcast/audio player for BlueBlooded episodes, with accurate episode information and clips
- Profile creation and personalization
- Integration with other large statistical sites like EvanMiya and KenPom

- Discussion boards for users about college basketball topics
- Content upload system so Ryan Hammer can upload videos and podcasts
- React Native front-end for iOS and Android
- FastAPI Backend connecting to Supabase database

Constraints/Risks:

- Solo App Developer
- July target initial launch
- App Store review delays
- Using third-party stats APIs
